2. Connect the other connector of the Ethernet cross cable to a personal computer.
3. Set the Audio-Video switch of the system set-up panel.

## Connection (excluding PU-109 board)

Connect the Ethernet terminal of the rear panel to a personal computer using an Ethernet cross cable.

### Preparation

1. Set the IP address and the sub-net mask of the MAV-555 to the factory settings.

#### Notes

- The IP address and sub-net mask can be confirmed in set-up menu No. 220.
- The factory settings are as follows:  
IP address : 192.168.0.1  
Sub-net mask : 255.255.255.0

2. Set the IP address and the sub-net mask of the personal computer as follows:  
IP address : 192.168.0.2  
Sub-net mask : 255.255.255.0
3. Start up the personal computer.
4. Wait for the MS-DOS prompt (or command prompt) to appear.
5. Input [ping 192.168.0.1].

Microsoft(R) Windows 95  
(C)Copyright Microsoft Corp 1981-1995.

C:\>ping 192.168.0.1

6. Confirm that the reply is returned normally.  
Message example (normally)

C:\>ping 192.168.0.1

Pinging 192.168.0.1 with 32 bytes of data:

C:\>

7. If the reply is not returned normally, input [arp -d 192.168.0.1] and perform from step 5 again.  
(There can be a case that the APR table information is left remained when two or more MAV-555s are connected continuously.)

### Procedure for acquiring log

1. Start up Tera Term (Tera Term Pro Ver.2.3 or higher).
2. When the Tera Term: New connection dialog box appears, click “Cancel”.

Confirm that “Tera Term – [disconnected]” is displayed in the title bar.

3. Select [Control] – [Macro] from the top menu.

4. Select [Log\_\*.ttl] file.

Note

To acquire all logs of the board, select [Log\_ALL.ttl] file.

The dialog box asks whether to acquire the DM2 (option) log. If this is not to be acquired, click “No”.

5. The log is acquired automatically and saved to a file.

File name (example)

LogFM\_1999-07-25: Log of FM-68 board (downloaded on July 25, 1999)

LogPuV\_1999-07-25: Log of PU-109 board and video (downloaded on July 25, 1999)

Note

Acquiring the same log twice or more on the same day rewrites the file because the file name is the same as the previous one.

6. Quit Tera Term.

### 1-3. Backing Up and Restoring the Contents of Memory (FM-68 board)

This section describes how to back up or restore the memory contents (IC350 to IC357, IC400 to IC407) of the FM-68 board from the MS-DOS prompt (or command prompt).

#### Note

- The file management information (file system) and the set-up information are stored in these memories. Before operating, back up the contents.
  - When replacing the FM-68 board
  - When replacing the memories (IC350 to IC357, IC400 to IC407) of the FM-68 board
  - When replacing the back-up battery of the FM-68 board
- Backing-up is possible when the file is loaded. However, when backing up for restoration when replacing the battery, unload the file and back it up. (If the file is not unloaded, an error occurs during restoration so that restoration cannot be performed.)
- The contents of SRAM are retained by the super capacitor when the battery is replaced. If the operation does not take a long time (sixty minutes or less), restoration does not need to be performed after replacing the battery.
  - If the following symptoms occur, restore the contents.
    - Data or time is not correct.
    - The file list does not appear on the display of the control panel.
    - The settings of the set-up menu have returned to the factory settings.

#### Connection

Connect the Ether terminal of the rear panel to a personal computer using an Ethernet cross cable.

#### Preparation

1. Set the IP address of the MAV-555 to the factory setting.

#### Notes

- The IP address and sub-net mask can be confirmed in set-up menu No. 220.

    - Sub-net mask : 255.255.255.0
2. Set the IP address and the sub-net mask of the personal computer as follows:
    - IP address : 192.168.0.2
    - Sub-net mask : 255.255.255.0
  3. Start up the personal computer.
  4. Wait for the MS-DOS prompt (or command prompt) to appear.
  5. Input [ping 192.168.0.1].
  6. Confirm that the reply is returned normally.
  7. If the reply is not returned normally, input [arp -d 192.168.0.1] and perform from step 5 again.

## Section 3

# Parts and Board Replacement

### 3-1. Cautions before Servicing

The hard disk drives (HDD) are installed in the MAV-555.

The HDD is a precision part. The causes such as shock, vibration and static electricity to the unit, and the conditions of temperature and humidity may damage HDD or its data.

Before servicing, read the following cautions carefully, and perform the servicing with extra care.

---

#### Cautions about Shock and Vibration

##### When transporting and moving

- Pack the unit using the packaging materials specified by the manufacturer.
- Use a proper cart.
- Put a cushion\* on the cart.
- Avoid rough routes, and manage the cart gently.

##### When placing on a floor or table

- Put a cushion\* on stable and horizontal place, and put the MAV-555 on it gently.
- Do not place the unit near vibrating equipment.

##### For the MAV-555 and HDD

- Never hit the HDD by a tool, and drop it on the MAV-555.

##### Take extra care

- Never give vibration or shock to the HDD during the power on, or within about 30 seconds after turning off the power.

\*Cushion : Polyethylene foam (density : 38 kg/m<sup>3</sup>, surface intrinsic resistance : 10<sup>11</sup> to 10<sup>12</sup> Ω, thickness : 50 mm) or equivalent.

---

#### Cautions about Removal/Installation of the MAV-555 from Rack

- Never give shock to all the rack mounted unit which has a HDD.
- Be sure to turn off the power of the rack mounted unit which has a HDD.

---

#### Cautions about Static Electricity

- Keep static-producing items such as plastics (air cap and others) away from the working area.
- When deal with the HDD, must be put on the earth-band to establish a ground.

---

#### Cautions about Temperature and Humidity

- Temperature and humidity of storage and operating conditions must be kept within the correct specified range.
- Never turn on the power with the cabinet is removed in consideration of the air-cooling effect.  
When turn on the power without installing the cabinet, it is essential that the unit should be covered with the substitute for the cabinet.

---

#### Cautions when an Error Appears in HDD

- Treat the MAV-555 conform to the above cautions, even when an error appeared.
- Keep the MAV-555 in the condition in which the error appeared, and write down the details of the error.

## Section 5

# Circuit Description

### 1. Reference Block

The REF signal that is used as the reference of the main unit is selected as described below. On the CN-1816 board, one of the REF signal and R1/R2 COMPOSITE VIDEO IN signal at the input terminal on the rear panel is first selected and output to the TM-40 board. This selection control signal is output from the TM-40 board. On the TM-40 board, moreover, the timing signal produced from the selected signal and the timing signal produced from an R1 or R2 SDI IN signal are selected and used as the REF signal of the main unit. The video and audio signals at a PB port and the MONITOR OUT video and audio signals output from the EM-1 board use this REF signal as reference. The signal that controls the time slot at each port also uses this REF signal as reference. The data transfer, recorded and reproduced in HDD, between the DM-120 and PU-109 boards is also performed in synchronization with this REF signal.

### 2. Video Block

#### REC mode

A video signal is usually input from the SDI (COMPONENT) IN terminal of an R1 port. The SDI signal input to the rear panel is directly sent to the DPR-127 board via a coaxial cable. The SDI active through signal produced on the DPR-127 board is also directly sent to the rear panel via a coaxial cable. If BKMA-511 (option) is inserted into each port, the analog composite signal input to the COMPOSITE IN signal terminal on the rear panel is passed through the buffer on the CN-1816 board and input to the AD-160 board via the MB-845 board. On the AD-160 board, the analog composite signal is Y/C-separated. The C (chroma) signal is also decoded to B-Y and R-Y signals, converted into three (Y, B-Y, and R-Y) component signals, and input to the DPR-127 board. On the DPR-127 board, the input signal from the SDI IN terminal and the signal from the AD-160 board are selected to compress a video signal. The compression system is MPEG2 4:2:2 Profile @ML. An intra-frame is compressed in this case. The compressed video data is converted into an HDD-write format (packing), multiplexed with audio data, and output to the DM-120 board. On the DM-120 board, the data is loaded into memory once and transferred to the PU-109 board as video data and HDD command data in synchronization with the time slot signal in equipment. On the PU-109 board, the video data is processed so that it is distributed to each HDD (8 + parity). The processed video data is then output to the IF-751 board corresponding to each HDD in a ratio of 1 to 1. On the IF-751 board, data is written in HDD via SPC (SCSI Protocol Controller).

In this case, the information on the area of HDD in which data is written is obtained from the file system memorized in the FM-68 board when the video data is transferred from the DM-120 board to the PU-109 board. The information is added immediately before the video data as command data and output to the PU-109 board.

#### PB mode

Information is obtained from the file system memorized in the FM-68 board, and PB control data is output from the DM-120 board to the PU-109 board. The PB control data is decoded by the PU-109 board and the corresponding video data is read from HDD. The video data is sent to the DM-120 board through the IF-751 and PU-109 boards. On the DM-120 board, the video data sent from the PU-109 board is stored in memory once and one-frame video data is output to the DPR-127 board during one-frame period. On the DPR-127 board, the video data is converted from an HDD write format (unpacking), input to an MPEG2 decoder, and decoded to a video signal. The decoded signal is output from the DPR-127 board to the rear connector panel as an SDI (COMPONENT) signal via a coaxial cable. If BKMA-512 (option) is inserted into each port, the video signal decoded using an MPEG2 decoder is output from the DPR-127 board to the DA-136 board and converted into a composite signal.

The video signal is then converted from digital to analog and output as an analog composite signal through the MB-845 and CN-1816 boards.

#### Monitor system and others

The four signals in recording systems (R1 and R2) and playback systems (P1 and P2) are sent from the DPR-127 board to the EM-1 board as a monitor signal. One of these signals is selected on the EM-1 board. The selected signal is mixed in characters, converted into an SDI signal, and output to the rear panel via a coaxial cable. After the output signal is converted into a composite signal, it is converted from digital to analog and output to the rear panel through the MB-845 and CN-1816 boards as an analog composite signal.

Moreover, animation data is output from the EM-1 board to the control panel (BKMA-505). The video signal at each port is selected using a router by the control operation from the control panel. The video signal is then converted into an analog composite signal and output through the MB-845 board to the multi-connector on the front panel and the rear panel as a control panel signal.

### 3. Audio Block

An audio signal is usually input from the SDI (COMPONENT) IN terminal or AES/EBU terminal of an R1 port (selectable). The audio signal input from the AES/EBU terminal is input to the DPR-127 board through the CN-1816 and MB-845 boards. If BKMA-511 (option) is inserted into each port, the analog signal input to BKMA-570 (option) is passed through the AUDIO I/F terminal on the rear panel and directly sent from the rear panel to the AD-160 board via a harness. On the AD-160 board, the analog signal is converted from analog to digital and sent to the DPR-127 board. The three types of signals (SDI, AES/EBU, and analog) sent to the DPR-127 board are sent to the sub-board (APR-44 board) of the DPR-127 board. After one of these signals is selected, it is converted into an HDD-write format (packing) and output to the DPR-127 board again. On the DPR-127 board, the output signal is multiplexed with the compressed video data. On the DM-120 board, PU-109 board, IF-751 board, and HDD (1+1), the output signal is processed and recorded in the same manner as for video data. On the HDD, IF-751 board, PU-109 board, and DM-120 board, a signal is also processed in the same manner as for video data during playback. The reproduced audio data is input through the DPR-127 board to the sub-board (APR-44 board) and converted into an HDD-write format (unpacking). The data then branches into two paths via the processing display. One is added to an SDI signal and output to the DPR-127 board. The other is converted into an AES/EBU signal by the APR-44 board and output from the rear panel through the DPR-127, MB-845, and CN-1816 boards. If BKMA-512 (option) is inserted into each port, the reproduced audio data is output from the APR-44 board to the DA-136 board through the DPR-127 and MB-845 boards. The output data is then converted from digital to analog and output to the AUDIO I/F terminal on the rear panel through the harness. After that, the output data is sent to BKMA-570 (option).

### 4. Raid Block

The raid block consists of a PU-109 board, IF-751 boards (11), and HDDs (11). A data bus is connected from the DM-120 (standard and optional systems) and FM-68 boards to the raid block. In a video system, two systems are used in reciprocation via a 16-bit bus. In an audio system, two systems are used in reciprocation via an 8-bit bus. For the video system, the processing in raid level 3 is carried out. For the audio system, the processing in raid level 1 is carried out. For the video system, the data divided into four blocks is input from the DM-120 board to the PU-109 board. The input data is assigned to two HDDs per block and recorded on eight HDDs in total. The parity for eight HDDs is assigned to one HDD. For the audio system, mirror data is input from the DM-120 board to the PU-109 board and striped into two HDDs on the PU-109 board. Data is output through the MB-853 board from the PU-109 board to the IF-751 board corresponding to HDD in a ratio of 1 to 1.

The IF-751 board mounts SPC controlled by SCSI. This board interfaces with HDD through the MB-853 and CN-1830 boards. During PB operation, data is ECC-processed on the PU-109 board and output to the DM-120 board. On the PU-109 board, data is automatically rebuilt or patrol-sought using an empty time slot.

## 5. Control Block

The MAV-555 uses MPC860 as CPU. One MPC860 is each mounted for the EM-1, TM-40, FM-68, and DM-120 boards. Two MPC860s are mounted for the PU-109 board. On the EM-1, TM-40, FM-60, and DM-60 boards, dual port RAM (DPM) is used for the inter-board communication.

Each board controls the following functions.

The TM-40 board is connected with DPM on the DM-120, FM-68, and EM-1 boards so as to control DPM on each board. During communication between boards, the control operation is usually performed through DPM on the TM-40 board. The TM-40 board also communicates with the control panel. This board distributes the command from the control panel to the DM-120, FM-68, and EM-1 boards or transfers the information from each board to the control panel. UDP is used as the communication protocol between the control panel and TM-40 board. Moreover, the TM-40 board manages a time slot or controls a reference signal.

The FM-68 board manages a file system, performs the system management (error or warning) of the whole unit, or memorizes a setup menu. The FM-68 board also communicates with the PU-109 board and acquires the raid status.

On the DM-120 board, the control signal input from the RS-422 connector on the rear panel is input to the DM-120 board through the CN-1817 and MB-845 boards. The input signal controls the REC/PB system and audio/video processing system. A CPU bus is connected from the DM-120 board to the DPR-127, APR-44, AD-160, and DA-136 boards at the corresponding port. The DM-120 board also controls the flow of audio and video data with respect to the PU-109 board during REC/PB operation as well as controlling these boards.

The EM-1 board mainly communicates with the meter panel. The communication with the meter panel is carried out through the FP-115 and MB-845 boards using the dual port RAM (DPM) on the FP-115 board. Moreover, the AV monitor signal of the main unit is AV-processed, routed, and superimposed, and output from the rear panel. An RS-422 (VTR) signal or remote parallel signal is input from the connector on the rear panel and sent through the MB-845 board to the EM-1 board so as to control the editing and effect functions and AV router.

The PU-109 board mounts each CPU for video and audio systems and controls the raid-related block.

## 6. Meter Panel (Top panel on the Front Panel)

The fluorescent (FL) display tube, buttons, switches, and rotary encoders on the meter panel are controlled by the FP-115 board. The FP-115 board communicates with the EM-1 board, and notifies each board of each setting through the EM-1 board or acquires it.

For the headphone jack pin on the meter panel, the analog audio signal from the EM-1 board is output through the MB-845 board. The signal whose gain was changed using the headphone volume is output through the MB-845 board to the EM-1 board again.

## 7. Time Slot

The MAV-555 can simultaneously access the four ports (maximum) of an AV signal. Therefore, a time slot system is used for how to access the data in a raid block. Actually, the DM-120 board (provided as a standard feature) that inputs and outputs 1IN (R1) and 1OUT (P1) AV data and the DM-120 board that inputs and outputs optional 1IN (R2) and 1OUT (P2) AV data are connected using the same buses (the bus transferred to the raid block and the bus transferred from the raid block) as for the PU-109 board. Each port (R1, R2, P1, or P2) uses the buses for communication or data transfer by time sharing. When the four ports are all used for recording and playback, the time that each port can occupy is four frames. The MAV-555 can access the raid block every 16 frames.

If a port to which any access (recording/playback) is not gained exists, however, another port uses the empty time slot of the port so as to increase the access speed or a raid block uses the empty time slot for rebuilding. The use of an empty time slot changes dynamically.

## SAFETY CHECK-OUT

After correcting the original service problem, perform the following safety checks before releasing the set to the customer :

Check the metal trim, "metallized" knobs, screws, and all other exposed metal parts for AC leakage. Check leakage as described below.

### LEAKAGE TEST

The AC leakage from any exposed metal part to earth ground and from all exposed metal parts to any exposed metal part having a return to chassis, must not exceed 3.5 mA. Leakage current can be measured by any one of three methods.

1. A commercial leakage tester, such as the Simpson 229 or RCA WT-540A. Follow the manufacturers' instructions to use these instruments.
2. A battery-operated AC milliammeter. The Data Precision 245 digital multimeter is suitable for this job.
3. Measuring the voltage drop across a resistor by means of a VOM or battery-operated AC voltmeter. The "limit" indication is 5.25 V, so analog meters must have an accurate low-voltage scale. The Simpson 250 and Sanwa SH-63Trd are examples of a passive VOM that is suitable. Nearly all battery operated digital multimeters that have a 20 V AC range are suitable. (See Fig. A)

## Section 2

### Semiconductor Pin Assignments

The following describes the semiconductor types used in this unit.

For semiconductors marked with page numbers in the index, refer to the corresponding pages in this section.

However, in some cases incompatible types are also listed, therefore, when a part is to be replaced, also refer to the Spare Parts section.

In addition, for semiconductors with ID Nos., refer to the separate CD-ROM titled “Semiconductor Pin Assignments” (Sony Part No. 9-968-546-xx) that allows searching for parts by semiconductor type or ID No.

The semiconductors in the manual or on the CD-ROM are listed by equivalent types. Thus the external view or the index mark indication may differ from the actual type.

Pin assignments and block diagrams are based on the IC manufacturer’s data book.

本機に使用されている半導体型名の一覧を下記に示します。索引中、ページが記載されている半導体は、本章の該当ページを参照してください。ただし、互換性のない型名を併記している場合がありますので、部品を交換するときは、Spare Partsの章を参照してください。

また、ID番号が記載されている半導体は、別途発行の“Semiconductor Pin Assignments” CD-ROM版 (ソニー部品番号：9-968-546-xx)を参照してください。

半導体型名またはID番号から検索ができます。

The schematic diagram illustrates the control logic for a 1000-ton hydraulic press. It features four IC1000 (1/5) SN74LV32APWR logic chips, each configured as a 3-input OR gate. The inputs to these chips are derived from various signals, including MA-WE1+, MA-WE2+, MA-WE3+, MA-CE3+, and MA-CE2+. The outputs of the logic chips are connected to the control inputs of the IC1002, IC1003, IC1004, and IC1005, which are also configured as 3-input OR gates. The outputs of these chips are connected to the control inputs of the IC1000 (1/5) SN74LV32APWR logic chips. The diagram also shows the power supply connections for the logic chips, including VCC, GND, and a 10k pull-up resistor on the input line. The output of the logic chips is connected to the control inputs of the IC1002, IC1003, IC1004, and IC1005, which are also configured as 3-input OR gates. The outputs of these chips are connected to the control inputs of the IC1000 (1/5) SN74LV32APWR logic chips. The diagram also shows the power supply connections for the logic chips, including VCC, GND, and a 10k pull-up resistor on the input line.

## SAFETY CHECK-OUT

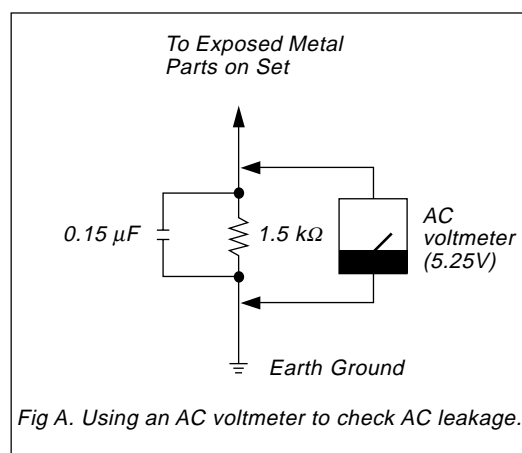

After correcting the original service problem, perform the following safety checks before releasing the set to the customer :

Check the metal trim, "metallized" knobs, screws, and all other exposed metal parts for AC leakage. Check leakage as described below.

## LEAKAGE TEST

The AC leakage from any exposed metal part to earth ground and from all exposed metal parts to any exposed metal part having a return to chassis, must not exceed 3.5 mA. Leakage current can be measured by any one of three methods.

1. A commercial leakage tester, such as the Simpson 229 or RCA WT-540A. Follow the manufacturers' instructions to use these instruments.
2. A battery-operated AC milliammeter. The Data Precision 245 digital multimeter is suitable for this job.
3. Measuring the voltage drop across a resistor by means of a VOM or battery-operated AC voltmeter. The "limit" indication is 5.25 V, so analog meters must have an accurate low-voltage scale. The Simpson 250 and Sanwa SH-63Trd are examples of a passive VOM that is suitable. Nearly all battery operated digital multimeters that have a 20 V AC range are suitable. (See Fig. A)
